

ABSTRACT OF THE DISCLOSURE

A method, system, and business method are disclosed for providing a marketplace for computing capacity in a network. An indication of needed computing capacity, including a bid amount, and an indication of available excess computing capacity, including an ask amount, are received in the computing capacity marketplace server for a plurality of computers in the network. The method creates a computing capacity marketplace by matching the bid amount with the ask amount, thereby enabling one computer to provide at least a portion of its available computing capacity to another computer in response to the matching step.
